Sec No- 3	Team No- 19	Project Title- WINES MANAGEMENT SYSTEM
------------------	--------------------	---

01.Abstract

The Wines Management System is a database management system designed to store and manage information about wines, customers, suppliers, inventory, and sales orders in a structured relational database. Manual management of these records can cause data redundancy, inconsistency, and difficulty in retrieving required information. The proposed system provides a centralized database for maintaining wine details such as wine name, category, price, quantity, and supplier information. It also stores customer details and order information and maintains inventory records. Primary keys and foreign keys are used to establish relationships among the entities. The system demonstrates important DBMS concepts such as entity relationship modeling, relational database design, normalization, constraints, CRUD operations, SQL queries, joins, aggregate functions, and transactions. It can generate useful information such as available stock, customer order history, total sales, and low-stock products. The main objective is to develop an efficient and reliable database that reduces data redundancy and maintains data consistency while providing fast and organized access to wine management information

02.Team Details

Roll Number(s)	Name of the Student	Signature
2520090185	S VENUGOPAL	
2520090079	V PAVAN KUMAR	
2520090208	ABHISHEK YADAV	

03.Frameworks / Platforms / Software Used

MySQL; SQL; MySQL Workbench; ER Diagram
